DEFINITION OF SYMBOLS

Symbol	Definition
F	Thrust, N
F/W_o	Initial thrust-to-weight ratio (based on weight at Earth sea level)
f	Stage mass fraction, (W_P/W_A)
g	Gravitational acceleration, m/sec^2
H	Energy
h	Altitude, km
Δh	Altitude change, $(h - h_o)$, km
I_{sp}	Specific impulse, sec
m	Mass, kg
r	Radius, km
R	Planet radius, km
r_o	$(h_o + R)$, km
t_B	Burning time, sec
V	Velocity
V^*	Comparative velocity
V_1	Stage characteristic velocity
V_∞	Hyperbolic excess velocity
W_A	Stage weight, $(W_o - W_L)$, N
W_L	Payload weight, N
W_o	Gross weight, N

DEFINITION OF SYMBOLS (Continued)

Symbol	Definition
W_P	Propellant weight, N
X	Range, km
α	Angle of attack (angle between velocity vector and thrust vector), deg
ζ	Propellant mass fraction, (W_P/W_O)
ϑ	Flight path angle from vertical, deg
μ	Gravitational constant
ψ	Central angle, deg
Subscripts	
C	Burnout
esc	Escape
ex	Exhaust
f	Final
id	ideal
K	Circular
o	Initial
P	Propellant

N	Newton

PERFORMANCE ANALYSIS OF CHEMICAL STAGES IN THE 300 TO 400 SECOND SPECIFIC IMPULSE RANGE FOR INTERPLANETARY MISSIONS

SUMMARY

The effect of thrust-to-weight ratios and specific impulses on trajectory parameters has been investigated for hyperbolic escape from, and braking into, an orbit about Earth. For the escape trajectories, the thrust vector was applied tangential to the flight path and in the direction of the velocity vector. For the braking-in trajectories, the thrust vector was directed against the velocity vector. Thrust-to-weight ratios of 0.2 to 1.0 and specific impulses of 300 to 400 seconds were used.

The results of the study are presented graphically.

INTRODUCTION

A study of the trajectory requirements is of fundamental importance in planning interplanetary round-trip missions. Preliminary analysis of the mission requires a rapid method of sufficient accuracy for determining the trajectory parameters. The sizing of boost vehicles is dependent, to a large extent, on the velocity requirements of the particular trajectory chosen.

The purpose of this study is to present a method for determining the trajectory parameters and vehicle mass characteristics for a specific mission, when the hyperbolic excess velocity is known.

The approach used for escape from orbit was to determine the trajectory parameters at burnout, convert the characteristic velocity to a hyperbolic excess velocity, and then present the data graphically. The approach used for braking into orbit was to determine the arrival velocity for a given transfer trajectory and initiate burning such that circular orbit conditions are attained at burnout. The equations of motion were integrated on a digital computer, using a Runge-Kutta numerical integration procedure.

ASSUMPTIONS

The following is a summary of the basic assumptions used in this study:

1. For escape -- Acceleration of a single stage from a reference orbit about Earth, using a constant thrust directed along the velocity vector.
2. For braking -- Deceleration of a single stage from an interplanetary transfer trajectory to a reference orbit about Earth, using a constant thrust directed against the velocity vector.
3. Reference orbit about the Earth was circular with a radius of 6556 km and a velocity of 7798 m/sec.
4. Constant specific impulse values from 300 to 400 seconds.
5. The thrust-to-weight ratios used were varied parametrically from 0.2 to 1.0.
6. Mean spherical Earth:

$$\mu = 398606.6 \text{ km}^3/\text{sec}^2$$

$$R = 6371.27 \text{ km}$$

ANALYSIS

For interplanetary flight, the ideal¹ total energy that must be imparted to the spacecraft is the ideal energy required to escape the gravitational field of the planet, plus the energy required to change its path about the Sun. The ideal energy required to escape the gravitational attraction of a planet can be determined from two-body mechanics to be $H_{\text{esc}} = \mu/r$ and the energy needed to alter the flight path about the Sun, H_{∞} , is determined by the characteristics of the interplanetary trajectory.

For determining the vehicle size necessary to inject the spacecraft into the interplanetary trajectory, it is convenient to express the ideal total energy, $H = H_{\text{esc}} + H_{\infty}$, in terms of a burnout velocity. This produces equations of the following forms:

$$V_C = \sqrt{H_{\text{esc}} + H_{\infty}} \tag{1}$$

¹ The term "ideal" refers to an instantaneous change of energy.

or

$$V_C = \sqrt{(V_{esc})^2 + (V_\infty)^2} \quad (2)$$

When considering finite vehicle systems there is an additional energy requirement, H_{loss} , which results from expending the propellants at different energy levels. Therefore, the total velocity increment for the injecting stage is now

$$V_1 = V_C - V_0 + V_{loss} \quad (3)$$

where V_0 is the initial velocity. The vehicle mass characteristics can be determined from the equation

$$\frac{W_0}{W_C} = e^{\frac{V_1}{V_{ex}}} \quad (4)$$

To accomplish this study, the two-degree-of-freedom equations of motion were numerically integrated.

Referring to the sketches, "a" for escaping from and "b" for braking into, computations were made for a point mass moving in a plane using the following equations of motion:

$$\dot{V} = \frac{F \cos \alpha}{m} - \frac{\mu}{r^2} \cos \vartheta \quad (5)$$

$$V \dot{\vartheta} = \frac{F \sin \alpha}{m} + \left(\frac{\mu}{r^2} - \frac{V^2}{r} \right) \sin \vartheta \quad (6)$$

$$\dot{r} = V \cos \vartheta \quad (7)$$

$$\dot{\psi} = \frac{V \sin \vartheta}{r} \quad (8)$$

where

$$m = m_0 + \int \dot{m} dt \quad (9)$$

and

$$\dot{m} = - \frac{F}{V_{ex}} \quad (10)$$

SKETCH a. ESCAPE FROM ORBIT

SKETCH b. BRAKE TO ORBIT

The velocity and flight path angle may be obtained by integrating the equations of motion

$$V = V_O + \int \dot{V} dt \quad (11)$$

$$\vartheta = \vartheta_O + \int \dot{\vartheta} dt \quad (12)$$

The range and altitude can be calculated by the relations

$$X = X_O + \int V \sin \vartheta dt \quad (13)$$

$$h = h_O + \int \dot{h} dt \quad (14)$$

The central angle is

$$\psi = \psi_O + \int \frac{\dot{X}}{r} dt \quad (15)$$

The initial weight of the stage is

$$W_O = W_C + W_P \quad (16)$$

The velocity expended by the stage is the characteristic velocity, or

$$V_1 = V_{ex} \ln \left(\frac{1}{1 - \zeta} \right) \quad (17)$$

Then the velocity losses are the difference between the characteristic velocity and the change in comparative velocity, or

$$V_{loss} = V_1 - \Delta V^* \quad (18)$$

where the comparative velocity is

$$V^* = \sqrt{V^2 + 2\mu \left(\frac{1}{R} - \frac{1}{r} \right)} \quad (19)$$

For ascent from $r = r_O$ to $r = r_f$, the change in comparative velocity is

$$\Delta V^* = \sqrt{V_f^2 + 2\mu \left(\frac{1}{r_O} - \frac{1}{r_f} \right)} - V_O. \quad (20)$$

and the velocity loss due to gravity is

$$V_{\text{loss}} = V_{\text{ex}} \ln \left(\frac{1}{1 - \zeta} \right) - \left[\sqrt{V_f^2 + 2\mu \left(\frac{1}{r_o} - \frac{1}{r_f} \right)} - V_o \right] \quad (21)$$

For descent from $r = r_o$ to $r = r_f$, the change in comparative velocity is

$$\Delta V^* = \sqrt{V_o^2 + 2\mu \left(\frac{1}{r_f} - \frac{1}{r_o} \right)} - V_f \quad (22)$$

and the velocity loss due to gravity is

$$V_{\text{loss}} = V_{\text{ex}} \ln \left(\frac{1}{1 - \zeta} \right) - \left[\sqrt{V_o^2 + 2\mu \left(\frac{1}{r_f} - \frac{1}{r_o} \right)} - V_f \right] \quad (23)$$

DISCUSSION OF RESULTS

The results of this investigation are presented graphically in Figures 1 through 11 for each of the two areas considered.² The stage characteristic velocity, V_1 , is plotted versus hyperbolic excess velocity, with thrust-to-weight ratios as a parameter, in Figures 1 through 5.

Figures 6 and 7 show the velocity losses, V_{loss} , due to gravity for specific impulse values of 300 seconds and 400 seconds, respectively. The flight path angle at burnout for departure trajectories and at initiation of burning for braking trajectories is shown versus hyperbolic excess velocity in Figure 8.

Figure 9 gives the change in altitude. This change is the difference between the altitude of the reference orbit about the planet and the altitude at burnout for the departure trajectories, and the difference between the altitude of the reference orbit and the altitude at initiation of burning for braking trajectories. The change in other trajectory parameters is shown in Figures 10 and 11.

The vehicle mass characteristics can be determined from Figures 12 and 13 in the Section entitled "Brake to Earth Orbit."

² Figure references apply to each of the two areas considered.

CONCLUSIONS

From these parametric analyses, sufficient data are provided to enable the designer to make a preliminary design of a stage that will accomplish any one of the mission areas studied when that particular mission's requirements are defined.

"The aeronautical and space activities of the United States shall be conducted so as to contribute . . . to the expansion of human knowledge of phenomena in the atmosphere and space. The Administration shall provide for the widest practicable and appropriate dissemination of information concerning its activities and the results thereof."

—NATIONAL AERONAUTICS AND SPACE ACT OF 1958

NASA SCIENTIFIC AND TECHNICAL PUBLICATIONS

TECHNICAL REPORTS: Scientific and technical information considered important, complete, and a lasting contribution to existing knowledge.

TECHNICAL NOTES: Information less broad in scope but nevertheless of importance as a contribution to existing knowledge.

TECHNICAL MEMORANDUMS: Information receiving limited distribution because of preliminary data, security classification, or other reasons.

CONTRACTOR REPORTS: Technical information generated in connection with a NASA contract or grant and released under NASA auspices.

TECHNICAL TRANSLATIONS: Information published in a foreign language considered to merit NASA distribution in English.

TECHNICAL REPRINTS: Information derived from NASA activities and initially published in the form of journal articles.

SPECIAL PUBLICATIONS: Information derived from or of value to NASA activities but not necessarily reporting the results of individual NASA-programmed scientific efforts. Publications include conference proceedings, monographs, data compilations, handbooks, sourcebooks, and special bibliographies.

Details on the availability of these publications may be obtained from:
